

## 12.5: Lines & Planes in Space

### Lines

The **vector equation** for line L through  $P_0(x_0, y_0, z_0)$  parallel to vector  $\vec{v}$ :

$$\vec{r}(t) = \overbrace{\vec{r}_0}^{P_0} + t\vec{v} \quad (-\infty < t < \infty)$$

The **standard parametrization** through  $P_0(x_0, y_0, z_0)$  parallel to  $\vec{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ :

$$x(t) = x_0 + tv_1$$

$$y(t) = y_0 + tv_2$$

$$z(t) = z_0 + tv_3$$

If is line,  $-\infty < t < \infty$ . If t is bounded, is line segment.

### Distance from point to line

$$d = \frac{\left\| \overrightarrow{PS} \times \vec{v} \right\|}{\left\| \vec{v} \right\|}$$

### Planes

The **vector equation** for a plane through  $P_0(x_0, y_0, z_0)$  with normal vector  $\vec{n} = A\mathbf{i} + B\mathbf{j} + C\mathbf{k}$  is given by:

$$\vec{n} \cdot (\overrightarrow{P_0P}) = 0$$

Component equation:

$$A(x - x_0) + B(y - y_0) + C(z - z_0) = 0$$

## Angle between two planes

- Parallel planes have the same normal.
- Angle between two intersecting planes = acute angle between normals

$$\left( \cos \theta = \frac{|\vec{n}_1 \cdot \vec{n}_2|}{\|\vec{n}_1\| \|\vec{n}_2\|} \right)$$

## Distance from point to plane

$$d = \left\| \text{proj}_{\hat{n}} \overrightarrow{PS} \right\| = \overrightarrow{PS} \cdot \overbrace{\hat{n}}^{\text{normalized } \vec{n}}$$

Use this to find distance between skew lines

- Given lines  $l_1, l_2$ , find normalized normal vector  $\vec{n}$ , and project  $\overrightarrow{PS}$

## Intersecting lines & planes

### Lines

Lines:  $l_1, l_2$  can be: parallel, coincident, skew, intersecting

- coincident: same line
- skew: neither parallel nor intersecting

**If direction vectors are same, parallel or coincident**

- Pick point on  $l_1$ . If on  $l_2$ , coincident
- Else parallel

### If not, skew or intersecting

- Check for intersecting point. If exists, intersecting
- Else skew

## Planes

Parallel, intersecting, coincident

- If normals are parallel, planes are parallel
- If normals are not parallel, cross product gives direction vector for line of intersection of the planes

## Line & Plane

- Substitute line into plane and find point where line & plane intersect

# 12.6: Cylinders and Quadric Surfaces

**Cylinder:** surface generated by moving straight line along given planar curve, holding line parallel to given fixed line

- Curve used to make cyl. is the **generating curve**

**Quadric Surface:** 2nd degree equation in x, y, z

$$Ax^2 + By^2 + Cz^2 + Dxy + Exz + Fyz + Gx + Hy + Jz + K = 0$$

**Elliptical Paraboloid:**  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{z}{c}$

**Ellipsoid:**  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$

**Elliptical Cone:**  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{z^2}{c^2}$

**Hyperboloid of One Sheet:**  $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$

**Hyperboloid of Two Sheets:**  $-\frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$

**Hyperbolic Paraboloid:**  $\frac{y^2}{b^2} - \frac{x^2}{a^2} = \frac{z}{c}$

Saddle from "how to theoretically turn a sphere inside out" lookin ass

## 13.1, 13.2: Vector Functions

Vector function  $\vec{f}: \mathbb{R} \mapsto \mathbb{R}^n$

- Given real valued functions  $f_1, f_2, f_3$ ,
  - $\vec{f}(t) = f_1(t)\mathbf{i} + f_2(t)\mathbf{j} + f_3(t)\mathbf{k}$
- $f_1, f_2, f_3$  are the **components** of  $\vec{f}$
- Parametrization should be obvious

## Limits of Vector Functions

Let  $\vec{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$ ,

$$\lim_{t \rightarrow t_0} \vec{r}(t) = \vec{L}$$

if for every  $\epsilon > 0$ , there exists corresponding  $\delta > 0$  such that for all  $t \in D$ ,

$$\|\vec{r}(t) - \vec{L}\| < \epsilon \text{ whenever } 0 < |t - t_0| < \delta$$

idk why i wrote that cause basically the idea is: to find lim, find lim of each component

$\vec{f}$  is **continuous** at point  $t = t_0$  if  $\lim_{t \rightarrow t_0} \vec{f}(t) = \vec{f}(t_0)$

( $\vec{f}$  is continuous if all points are continuous)

## Limit rules

Given  $\vec{f}(t) \rightarrow \vec{L}, \vec{g}(t) \rightarrow \vec{M}, u(t) \rightarrow U$ , then:

1.  $\vec{f}(t) + \vec{g}(t) \rightarrow \vec{L} + \vec{M}$
2.  $\alpha \vec{f}(t) \rightarrow \alpha \vec{L}$
3.  $u(t) \vec{f}(t) \rightarrow U \vec{L}$
4.  $\vec{f}(t) \cdot \vec{g}(t) \rightarrow \vec{L} \cdot \vec{M}$
5.  $\vec{f}(t) \times \vec{g}(t) \rightarrow \vec{L} \times \vec{M}$

## Derivatives of Vector Functions

$$\vec{r}'(t) = \lim_{\Delta t \rightarrow 0} \frac{\vec{r}(t + \Delta t) - \vec{r}(t)}{\Delta t}$$

If limit exists,  $\vec{r}$  is **differentiable** at  $t$ .

( $\vec{r}$  is differentiable if all points are differentiable)

$\vec{r}'$  is the same as the sum of the derivatives of each component

## Derivative rules

1.  $(\vec{f} + \vec{g})'(t) = \vec{f}'(t) + \vec{g}'(t)$
2.  $(\alpha \vec{f})'(t) = \alpha \vec{f}'(t)$
3.  $(\vec{f} \cdot \vec{g})'(t) = \vec{f}'(t) \cdot \vec{g}(t) + \vec{f}(t) \cdot \vec{g}'(t)$  (product rule, applies for *dot product*, *cross product*, *scalar multiplication*)
4.  $(\vec{f} \circ u)'(t) = \vec{f}'(u(t))u'(t)$  (chain rule)

## Tangent Lines, Velocity, Acceleration

$\vec{r}(t)$  is **smooth** if  $\frac{d\vec{r}}{dt}$  is continuous & never zero

Tangent line to smooth curve  $\vec{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$  at  $t = t_0$

is the line that passes  $\vec{r}(t_0)$  & is parallel to  $\vec{r}'(t_0)$ .

If  $\vec{r}$  is position,

- $\vec{v} = \frac{d\vec{r}}{dt}$  (velocity)
- $\vec{a} = \frac{d\vec{v}}{dt}$  (acceleration)
- direction of motion = direction of  $\vec{v}$
- speed =  $\|\vec{v}\|$

## Integrals of Vector Functions

$\vec{R}(t)$  is antiderivative of  $\vec{r}(t)$  on interval  $I$  if  $\frac{d\vec{R}}{dt} = \vec{r}$  at each point in  $I$ .

$$\int \vec{r}(t) dt = \vec{R}(t) + \vec{C}$$

(componentize to find indef/def integral)

### Integral rules

1.  $\int_a^b (\vec{f} + \vec{g})(t) dt = \int_a^b \vec{f}(t) dt + \int_a^b \vec{g}(t) dt$
2.  $\int_a^b (\alpha \vec{f})(t) dt = \alpha \int_a^b \vec{f}(t) dt$
3.  $\int_a^b (\vec{c} \vec{f})(t) dt = \vec{c} \int_a^b \vec{f}(t) dt$
4.  $\left\| \int_a^b (\vec{f})(t) dt \right\| \leq \int_a^b \|\vec{f}(t)\| dt$

## Projectile Motion

**Ideal projectile motion:** bro use kinematics
